Getting Started

How to Use GitScan

1. **Set up Github Account**: First you need to set up a Github account with repositories so we can scan your files. We request users to provide us access to their repositories through an authentication request.

2. **Get List of Public and Private Repos**: Once we acquire a list of all your private and public repositories, you may navigate to your list of repos and select which repositories you want to scan. In our Beta version, we are allowing users to scan one repositories at a time.

3. **Malware Scanning:** GitScan will start scanning your files and update you as soon as the reports are ready.

4. **Feedback Report:** Once our scan of your repo is finished, a detailed, file-by-file analysis of your repository for malware will be displayed.
